#### Feedback — Week 4 Quiz

Help

Thank you. Your submission for this quiz was received.

You submitted this quiz on Fri 27 Jun 2014 12:49 PM PDT. You got a score of 10.00 out of 10.00.

#### **Question 1**

What is produced at the end of this snippet of R code?

set.seed(1)
rpois(5, 2)

Your Answer	Score	Explanation
A vector with the numbers 1, 4, 1, 1, 5		
<ul><li>A vector with the numbers 3.3, 2.5, 0.5, 1.1,</li><li>1.7</li></ul>		
It is impossible to tell because the result is random		
A vector with the numbers 1, 1, 2, 4, 1	<b>✓</b> 1.00	Because the `set.seed()' function is used, `rpois()' will always output the same vector in this code.
Total	1.00 / 1.00	

## **Question 2**

Your Answer	Score	Explanation
dnorm		
pnorm		
• rnorm	<b>✓</b> 1.00	Functions beginning with the `r' prefix are used to simulate random variates.
qnorm		
Total	1.00 / 1.00	

#### **Question Explanation**

Standard probability distributions in R have a set of four functions that can be used to simulate variates, evaluate the density, evaluate the cumulative density, and evaluate the quantile function.

### **Question 3**

When simulating data, why is using the set.seed() function important?

Your Answer		Score	Explanation
It ensures that the random numbers generated are within specified boundaries.			
It ensures that the sequence of random numbers is truly random.			
It can be used to generate non-uniform random numbers.			
It ensures that the sequence of random numbers starts in a specific place and is therefore reproducible.	<b>~</b>	1.00	
Total		1.00 /	
		1.00	

### **Question 4**

Which function can be used to evaluate the inverse cumulative distribution function for the Poisson distribution?

Your Answer		Score	Explanation
o rpois			
• qpois	<b>~</b>	1.00	Probability distribution functions beginning with the `q' prefix are used to evaluate the quantile function.
dpois			
o ppois			
Total		1.00 /	
		1.00	

### **Question 5**

What does the following code do?

```
set.seed(10)

x <- rbinom(10, 10, 0.5)

e <- rnorm(10, 0, 20)

y <- 0.5 + 2 * x + e
```

Your Answer		Score	Explanation
Generate random exponentially distributed data			
Generate data from a Normal linear model	~	1.00	
Generate uniformly distributed random data			
Generate data from a Poisson generalized linear model			

Total 1.00 / 1.00

## **Question 6**

What R function can be used to generate Binomial random variables?

1.00	
1.00 / 1.00	
	1.00 / 1.00

# **Question 7**

What aspect of the R runtime does the profiler keep track of when an R expression is evaluated?

<b>✓</b>	1.00	
	1.00 / 1.00	
		1.00 / 1.00

# **Question 8**

#### Consider the following R code

```
library(datasets)
Rprof()
fit <- lm(y ~ x1 + x2)
Rprof(NULL)</pre>
```

(Assume that y, x1, and x2 are present in the workspace.) Without running the code, what percentage of the run time is spent in the 'lm' function, based on the 'by.total' method of normalization shown in 'summaryRprof()'?

Your Answer	Score	Explanation
23%		
<ul><li>100%</li></ul>	1.00	When using `by.total' normalization, the top-level function (in this case, `lm()') always takes 100% of the time.
<b>50%</b>		
○ It is not possible to tell		
Total	1.00 / 1.00	

#### **Question 9**

When using 'system.time()', what is the user time?

Then doing operanium o(); under a door time.			
Your Answer		Score	Explanation
It is a measure of network latency			
It is the time spent by the CPU waiting for other tasks to finish			
It is the "wall-clock" time it takes to evaluate an expression			
It is the time spent by the CPU evaluating an expression	~	1.00	
Total		1.00 /	

1.00

# **Question 10**

If a computer has more than one available processor and R is able to take advantage of that, then which of the following is true when using 'system.time()'?

Your Answer		Score	Explanation
elapsed time may be smaller than user time	~	1.00	
user time is 0			
<ul><li>elapsed time is 0</li></ul>			
user time is always smaller than elapsed time			
Total		1.00 / 1.00
